SUBUNIT: NGF RECEPTOR CAN FORM A HOMODIMER THROUGH DISULFIDE BOND FORMATION.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

FIM: N- AND O-GLYCOSYLATED AND IS PHOSPHORYLATED ON SERINE.

SIMILARITY: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION.

SIMILARITY: CONTAINS 1 DEATH DOMAIN.

THE ADAPTOR MOLECULE FADD RECRUITS CASPASE-8 TO THE ACTIVATED RECEPTOR. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTECUTIC ACTIVATION. ACTIVE CASPASE-8 INTILATES THE SUBSCUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS MAY HAVE A ROLE IN THE INDUCTION OF PERIPHERAL TOLERANCE, IN THE ANTIGEN STIMULATED SUICIDE OF MATURE T-CELLS, OR BOTH (BY SIMILARITY). SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

SUBCELLULAR LOCATION DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, DOMAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION. SIMILARITY: CONTAINS 1 DEATH DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RECEPTOR. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTEOLYTIC ACTIVATION. ACTIVE CASPASS-8 INSTINATES THE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS. FAS-MEDIATED APOPTOSIS MAY HAVE A ROLE IN THE INDUCTION OF PERIPHERAL TOLERANCE, IN THE ANTIGEN-STIMULATED SUICIDE OF MATURE T-CELLS, OR BOTH.

1. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

1. DOMAIN. CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, AND MAYBE TO OTHER CYTOSOLIC ADAPTOR PROTEINS.

1. SIMILARITY: CONTAINS A LA-MGER/TMER-TYPE CYSTEINE-RICH REGION.

1. SIMILARITY: CONTAINS A LA-MGER/TMER-TYPE CYSTEINE-RICH REGION.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is mouse osteoprotegerin (OPG). Anti-OPG antibodies can be used in OPG diagnostic assays, and as affinity purification materials. The OPG CDNA can be used to express recombinant OPG and to generate transgenic animals. It can also be used to regulate the level of OPG in mammals, specifically to increase OPG levels, however the use of antisense sequences is also contemplated. Fragments of the CDNA can be used as probes to detect OPG expressing cells and tissue, and to screen CDNA libraries for related sequences. OPG can be used to treat or prevent bone diseases, specifically excessive bone loss, e.g. osteoporosis, Paget's disease, hypercalcaemia, hyperparathyroidism, rheumatold arthritis, osteomyelitis, osteomyelitis, periodontal bone loss, bone necrosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                        antibodies can be used in OPG diagnostic assays, and as affinity purification materials. The OPG cDNA can be used to express recombinant OPG and to generate transgenic animals. It can also be used to regulate the level of OPG in mammals, specifically to increase OPG levels, however the use of antisense sequences is also contemplated. Fragments of the CDNA can be used as probes to detect OPG expressing cells and tissue, and to screen cDNA libraries for related sequences. OPG can be used to treat or prevent bone diseases, specifically excessive bone loss, e.g. osteopyric metastases, periodontal bone loss, bone necrosis and osteolytic metastases, periodontal bone loss, bone necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antisense oligonucleotide; probe; detection; screening; bone disease; osteoporosis; Paget's disease; hypercalcaemia; hyperparathyroidism; rheumatoid arthritis; osteomyelitis; osteolytic metastasis; periodontal bone loss; bone necrosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                c claimed methods of identifying agonists and antagonists, i.e.

C compounds that bind to the receptors or ligand, and which activate

( agonist) or inhibit activation of (antagonists) TR1, TR3, TR5 or

TI3. A screening kit for identifying agonists, antagonists

TR3, TR5 or

TI3 polypeptides is provided. The agonists and antagonists are

useful for treatment of chronic and acute inflammation, arthritis,

septicaemia, autoimmune disease e.g. inflammatory bowel disease,

psoriasis, transplant rejection, graft versus host disease,

infection, stroke, ischaemia, acute respiratory disease syndrome,

restenosis, brain injury, AIDS, bone diseases, cancer (e.g.

lymphoproliferative disorders), atherosclerosis and Alzheimer's

disease, etc., caused by imbalance of TR1, TR3, TR5 or TL3.

necrosis factor receptor (TNF-R) related polypeptides (TR1 and TL4). The method comprises: (a) (i) contacting TR1 or candidate compound in the presence of TL2 or TL4; or (ii) or

with

TL2 TL2

The invention relates to identifying agonists or antagonists to tumour

TR and TL agonists and antagonists are useful for treating diseases caused by imbalance of TL or TR polypeptide levels, which cause: chronic and acute inflammation, arthritis, septicemia, autoimmune diseases, transplant rejection, graft vs. host disease, infection, stroke, ischemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer, athersclerosis and Alzheimer's disease. The present sequence represents a TNF-R related polypeptide TR1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               having homology to tumour necrosis factor receptor. The sequence was deduced from that of a cDNA clone (see V69277) isolated from a cardiac coronary artery smooth muscle cell library. FTHMA-070 nucleic acids and polypeptides of the invention are useful as modulating agents in regulating a variety of cellular processes. They can be used for identifying compounds which bind to or modulate the activity of the polypeptides (claimed). They can also be used in screening assays, detection assays (e.g. chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials, and pharmacogenomics), and methods of treatment (e.g. therapeutic and prophylactic) e.g. for neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human FTHMA-070 and T85 proteins - used products for the diagnosis and therapy of disorders cellular processes, e.g. neuronal development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-OCT-1997;

The OCIF has a molecular weight by SDS-PACE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 1996-402320/40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                          specifically claimed in the present invention. The present invention describes: (1) a method of inhibiting the formation of osteoclasts and/or antipyretic proteins, which have the following characteristics: (1) MW determined by SDS-PAGE of approximately 60 kDa under reducing conditions, and 60 kDa and 120 kDa under non-reducing conditions; (ii) 401 as sequence (III) (see W53239); (iii), affinity to cation exchangers and heparin; (iv) its osteoclast formation inhibiting activity reduced by heating at 70 degrees Celsius for 10 minutes or 56 degrees Celsius for 30 minutes, and (v) its antipyretic activity reduced by heating at 90 degrees Celsius for 10 minutes, and (2) a method for preparing the above proteins. The proteins are useful for, e.g. treatment and prevention of osteoporosis, rheumatism or multiple sclerosis, and also as antigens for immunological diagnosis of these diseases and disorders.
                                                                                                                                                                                                                                                                                     Inhibition of osteoclast formation and/or antipyretic activity useful for, e.g. treating osteoporosis, rheumatism and multiple sclerosis % \left( 1\right) =\left\{ 1\right\}

The present sequence is human osteoprotegerin (OPG). Anti-OPG antibodies can be used in OPG diagnostic assays, and as affinity purification materials. The OPG cDNA can be used to express
                                                                                                                                                                                                                                                                                                                                                                                                    03-SEP-1996;

It can also be used to regulate the level of OPG in mammals, specifically tincrease OPG levels, however the use of antisense sequences is also contemplated. Fragments of the cDNA can be used as probes detect oPG expressing cells and tissue, and to screen cDNA libraries for related sequences. OPG can be used to tract or prevent bone diseases, specifically excessive bone loss, e.g. osteoporosis, Paget's disease, hypercalcaemia, hyperparathyroidism, rheumatoid arthritis, orteomyelitis, osteolytic metastases, periodontal bone loss, bone necrosis and

                                                                                                                                                                                                                                                                                                                                                                               This sequence is a tumour necrosis factor receptor-1 (TR1) receptor CC of the invention. The DNA can be used to produce a recombinant host CC cell by inserting it into a vector, which is then used to transfect the CC host cell. The TR1 receptor can bind both TNF-alpha and TNK-beta. TR1 CC receptor agonists can be used for inhibition of tumour growth and CC necrosis of tumours. They can also be used to stimulate cellular CC differentiation, e.g. T cell, fibroblasts or haematopoietic cell CC differentiation, may be used to augment TR1's role in the host's defence CC against microorganisms and prevent related disease. The agonists may CC also be used to protect against the deleterious effects of ionising CC radiation produced during a course of radiotherapy, e.g. denaturation of CC enzymes, lipid peroxidation or DNA damage. The agonists may further be used to mediate an anti-viral response, to regulate growth, to mediate the immune diseases and to treat immunodeficiencies related to diseases CS such as HIV. Antagonists to the TR1 receptor may be used to treat autoimmune diseases, e.g. graft versus host rejection and allograft crejection, and T cell mediated autoimmune diseases. They may also be used to treat septic shock, meningococcemia, inflammation, bacterial infections, cachexia, cerebral malaria or AIDS. The products can also be used to read for diseases.
                                                                                                                                                                                                                                                                                                        Query Match

                                                                                     This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C20s in which the 20th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          atches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C19S in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                  23-APR-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      R99942

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-CL in which amino acids 379-380 of the mature OCIF protein are deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

                                                                                                                                                                                                                                                                                                       This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C22S in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

                                   This sequence represents a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence represents OCIF-C21S in which the 21st Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
